D

good. Um, we might just record for Zoom just for as well.

0:11

David Denham

D

have as a backup just in case. Uh, perfect. okay, cool, so let me just, uh, let me just share my screen.

0:21

DUB Brennan 3W.103

D

point.

0:26

David Denham

D

two-way email.

0:29

DUB Brennan 3W.103

D

a good point.

0:32

David Denham

D

this one for a while.

0:40

DUB Brennan 3W.103

D

point.

0:40

David Denham

D

it, which we've kind of seen the results of during our recent refinement sessions. So really kind of just wanted to take a step back, look at the big picture. In terms of the why and the what, you know, what we're kind of targeting on a high level for. For the MVP, for the EA, launch, for two-way email. And yeah, they can get into story mapping as well.

David Denham

D

And Marcus, I know you you joined as well, so you know, definitely welcome to to participate in story mapping as well.

1:18

David Denham

D

don't have access.

1:25

DUB Brennan 3W.103

D

point.

1:27

David Denham

D

kind of thousand foot view. First of all, in terms of, um, you know, when we did the UH release planning, at the start of this release, we had a look at our at our roadmap. And, you know, from a PNT UM level, there's really three top priorities.

1:49

DUB Brennan 3W.103

D

point.

1:54

David Denham

D

open technology platform for her, us and our ecosystem to innovate.

2:07

David Denham

D

on. And really, the focus for two-way email, where this ties into the into the strategy for PNT and for Workday, is the focus on international growth.

2:19

DUB Brennan 3W.103

D

point.

2:19

David Denham

D

tier one countries, so tier one countries are UK, France, Germany, Australia.

2:26

DUB Brennan 3W.103

D

think that's a good point.

2:29

David Denham

D

miss?

2:29

DUB Brennan 3W.103

D

good point.

2:30

DUB Brennan 3W.103

D

that's a good point.

2:32

David Denham

D

Germany, France, Australia.

2:34

DUB Brennan 3W.103

D

point.

2:34

David Denham

D

Yeah, so there's a number of kind of high priority countries that we're targeting.

2:50

David Denham

D

countries.

2:51

DUB Brennan 3W.103

D

point.

2:51

David Denham

D

And.

2:55

DUB Brennan 3W.103

D

point.

2:56

David Denham

D

communication.

2:57

DUB Brennan 3W.103

D

point.

2:59

DUB Brennan 3W.103

D

point.

3:01

DUB Brennan 3W.103

D

you.

3:01

David Denham

D

which I know Collabora are working on, and also email. So just to provide a bit more context on that. So, particularly for regions where agencies are heavily used, so recruiting agencies, kind of think of them. Like, um, you know, external recruiters, I'm sure you probably used, you know, gone through, maybe agencies yourself when applying for applying for jobs. And in

certain regions, like Germany, France and Japan in particular, UM agencies are very heavily, heavily used.

David Denham

D

So, um, so it's given the more formal UM communication that recruiters have with agencies, and agencies obviously are coordinating with candidates as well. Email is often the primary communication method that agencies and recruiters prefer in those regions. So what happens today, obviously, we don't have two-way email. We have other methods, like ad hoc communication. There's SMS.

David Denham

D

There's WhatsApp. But recruiters are forced to work outside of workday to be able to send that type of communication. And we heard from customers during TPGs. User research that causes compliance risks and also slows down the process as well. So they're obviously working with multiple tools and they prefer to have it all within the workday system, or as much as possible, better for auditing, better for efficiency as well.

David Denham

D

So if you think about a recruiter gets sick, another recruiter needs to take over and actually just trying to catch up on communication. So if you have that all in one place, it makes it a lot easier. And also from a business outcomes point of view, we've lost deals to competitors. So we know the likes of ICMS and Oracle already have two-way emails. So it's something that we know we need to do to improve our product market fit for these type of regions.

David Denham

D

And then, yeah, just in terms of like... So that's the, you know, some of the business outcomes we're looking at in terms of, like, customer value. Um, really, we think that one of the main outcomes, or what we heard from customers is, um, reducing average time to hire. And so really, if you think about candidate going through the job application stages and the communication process happening with them, and we think we can reduce the the time to hire. So we have 10 there as kind of a um, as a, as a target.

David Denham

D

And that's kind of just based off some industry benchmarks and we can definitely refine that a little bit more. But basically we're reducing, um, again, going outside the system. And it was improving time to response from candidates as well and from agencies. We think that's going to, you know, help reduce time throughout the throughout the pipeline and and also reduce compliance risk as well. So again.

David Denham

D

And we want as as much or as close to 100 of recruiter to candidate and agency interactions happening, um, within workday, during the job application process as possible. Uh, so, yeah, how are we solving this? So working, uh, primarily with OE, so omnichannel engagement, uh, just if you're not familiar with the acronym there. Um, so, they're one of our partner teams, um, who look after messaging. So I know, again, Collabra would have worked very closely with them, and Emily, you would have worked very closely with them.

David Denham

D

For the likes of SMS in the past. And I know WhatsApp at the moment with Collabra. So partnering closely with them. And that's been the focus of our kind of early spike. Work is working with OE to understand what's needed.

David Denham

D

From kind of a backend point of view, and also from kind of a shared components point of view. So things like message builder, which will. Which we'll chat about in a in a minute. And we want to be able to surface that in the sliding slide panel, so hopefully everyone's familiar with the sliding side panel. And so again on the candidate profile.

David Denham

D

And we have an existing UM UI component in the UI container, called the sliding side panel, or sometimes called the collaboration panel. In recruiting, where there's some existing things like SMS, candidate notes, and also WhatsApp more. More recently as well. So we want to include email as one of the channels there. And then what does success look like?

David Denham

D

I suppose, again, just more from a business value point of view, really to increase our win rates in tier one countries. So again, it's something we've seen fairly regularly over time, you know, talking to the likes of our pre-sales team, that we've lost deals because of the lack of 2.8 mil. Versus our competitors. So that's gonna again improve our market, improve our market fit, and also make our make our lives for our recruiters and our customers a lot, a lot easier.

David Denham

D

Hopefully. Um, so yeah, I might just pause there. That's again just very, very high level. But any, any initial questions around any of that?

8:26

Marcos Ampezzan

M

Just a comment for the people who you just mentioned about the collaboration panel.

8:31

Marcos Ampezzan

M

that's why Colabra Kebabra is named as Colabra, because it was the first team to work on that. When we introduced the side panel, that was for notes in the beginning, and then it was added SMS and WhatsApp to that thing.

8:48

David Denham

D

show.

8:54

David Denham

D

There's also a famous Irish fast food place called Abercababra.

8:58

Marcos Ampezzan

M

it.

9:00

David Denham

D

I like the play on words as well. So yeah, absolutely.

9:08

David Denham

D

kind of collaborative notes. And then SMS was the second one. And then WhatsApp was the...

9:12

Marcos Ampezzan

M

yeah. The first was job application and job requisition notes, and then we had it was added candidate notes, and then SMS and WhatsApp.

9:21

David Denham

D

Yeah, absolutely. So, yeah, so this kind of helps round out the... The channels, Um, now again, there probably will be more channels in future. And I know in some countries like Japan. They've also got Um line, which is kind of their version of WhatsApp, but just there's lots of other things, um, and other countries have, you know, different apps as well.

David Denham

D

So I'm sure that's going to continue to to grow over time. But email and email is definitely a big, a big gap at the moment. Cool. Yeah. So, I suppose.

David Denham

D

Just to kind of summarize the pain point for the recruiter. So they're jumping between Workday and Outlook and Gmail, for example, and replies are basically not in the system. So,

leading to some lost context and audit trail gaps, collaboration friction when team members are out of the office. And then, just to summarize it in a user story, So again, what's the problem we're trying to solve. As a recruiter, I want to communicate via email directly from Workday Recruiting to a recruiting agency user or candidate.

David Denham

D

So I can message them in their trusted channel. Whilst ensuring all interactions are logged and visible for a comprehensive audit trail. So again, having as much of that back and forth, two-way email communication during the job application flow within workday recruiting is going to help. Make things more more efficient and also more compliant as well.

10:51

David Denham

D

Yeah, so it's just a few example use cases, just to kind of make it, you know, a bit more tangible. These were kind of use cases we heard through DPGs and through customer research or user research. So I saw it's typically, you know, it can vary from country to country. That that's one thing we did learn as well. So, um, you know, sometimes, um, organizations don't work with agencies, uh, they might just work directly with a candidate.

David Denham

D

So you've got, like, a recruiter to candidates communication and then um. Companies who do work with agencies typically work with agencies during the earlier stages of the flow. And then, you know, once and again, depending on the country. So Japan, for example, recruiters typically don't contact a candidate until the offer stage, whereas in other countries it tends to be earlier on in the flow.

11:54

DUB Brennan 3W.103

D

state is over.

11:55

David Denham

D

organisations. As to when does a recruiter start talking to a candidate after they've worked with an agency. So just something to bear in mind. But I suppose, again, if you kind of just think of it as a a journey through, you know the job application flow.

12:12

David Denham

D

that a recruiter can reach out to either of these personas, they can reply back.

12:19

DUB Brennan 3W.103

D

up.

12:19

David Denham

D

in the in the system. So um, so, yeah, just a few few high level use cases.

12:34

DUB Brennan 3W.103

D

up.

12:34

David Denham

D

system.

12:39

DUB Brennan 3W.103

D

wrap up.

12:40

David Denham

D

communicate via email. So that's kind of a key driver. They're working with lots of different organizations, some using Workday, some not using Workday.

12:51

David Denham

D

they do have an account, that's typically to be able to apply their candidates for jobs.

13:02

David Denham

D

for email to use that. So I suppose just to give that context as well.

13:06

David Denham

D

So, customers like Nissan highlighted the need to have an audible record of communication. So again, really important, that kind of auditability. And again, think of that agency user almost like an external recruiter.

13:18

DUB Brennan 3W.103

D

wrap up.

13:27

David Denham

D

who are applying.

13:28

DUB Brennan 3W.103

D

wrap up.

13:30

David Denham

D

Document requests, again, that's something we heard fairly frequently. You know. Updated CVs, corrections to emails, localised certifications, things like that.

13:54

David Denham

D

missing.

14:00

DUB Brennan 3W.103

D

wrap up.

14:00

David Denham

D

to track them down. You know, there's lots of other use cases, but just just some examples we heard, and then, uh, recruiter to candidate communication, so, um, we did hear. It's important also in organizations where email is the preferred channel.

14:21

David Denham

D

who have obviously a global customer.

14:25

David Denham

D

we did hear that. You know, WhatsApp is actually not permitted in their organization.

14:36

DUB Brennan 3W.103

D

up.

14:37

DUB Brennan 3W.103

D

up.

14:38

DUB Brennan 3W.103

D

wrap up.

14:40

David Denham

D

email is still, you know, very much a preferred preferred business communication channel. Candidate ad hoc query So again, maybe sending reminders, following up with candidates throughout the job application stages.

14:58

David Denham

D

or send message at the the moment. And that's one way, I suppose.

15:03

DUB Brennan 3W.103

D

wrap up.

15:04

David Denham

D

part to where the gap is. So recruiter could send an ad hoc message at the moment.

15:11

David Denham

D

of the system at the moment. So again, we want to bring those into the system and then things like offer negotiations. So again, if, if, if details are discussed by the candidates, um, over email again. A lot better to be able to and discuss those details, um, you know, within this system and have that kind of auditable trail as well of those of those communications.

15:32

DUB Brennan 3W.103

D

ahead and wrap up.

15:33

David Denham

D

again, a recruiter could be out sick or, you know, going on PTO, um, so again, making it easier for other recruiters to be able to take over as well.

15:45

David Denham

D

um, makes calibration as well, much easier. Um, yeah, so before we kind of talk about, you know, MVP and um, early adopters.

16:01

DUB Brennan 3W.103

D

up.

16:01

David Denham

D

to solve? Hopefully that makes sense. Um, yeah, so we look at the figment designs now. The second, but um, I suppose, just at a high level. Because, you know, when we think about email, you know, I suppose we don't want to go all the way to, you know, reinvent Outlook or reinvent Gmail, and we're not looking to build our own email client.

David Denham

D

This was, that's one thing, you know, I would say. We're very, I suppose. We want to be very targeted in terms of our use case against to have that bi-directional communication during the the job application flow. Um, and then there's certain things for, um, if you kind of think of like a steel thread, like, what's that, what's that? You know?

David Denham

D

Critical flow, almost like critical user journey through the UM, through the job application, where this two-way email is going to happen. So again, just from lots of back and forth, from the spikes, from, you know, discussions with, um, our OE partners. There's certain things that we want to target at a high level within the scope for MVP. We call these P0 items and then things that are, you know, post MVP, things that we consider either for general availability or for, you know, future roadmap. And call a few of those things out there.

David Denham

D

So things like AWS, SES integration, so Amazon web service, simple email service, which is what that means. integration. So basically, what that means is the back end service that OE are working on and for our front end to integrate with that. It's going to be on the sliding side

panel. So in terms of like, where we're placing it, displaying threads and email composition within a wider UI for email.

David Denham

D

So again, if you think about what we have already, so notes, SMS and WhatsApp. And they're typically shorter form messages, and, you know, think about it, if you're sending an email, it's typically a longer form message. So, and with that, we need to modify the existing sliding side panel. That's probably where most of, um, that's probably where most of our UM work, or, you know, most of the things that maybe we can't reuse from the other channels will come from where we need to. Modify the design of the of the side panel to fit a wider form factor for email.

David Denham

D

Integration with Message builder. So, Message Builder is actually a component or set of components built by the message builder team. They also live in OE, in that same organization as the team working on the backend email service. And you know, things like our you know, rich text editor, things like the to and subject. And from fields, things like that.

David Denham

D

We want to leverage as much of that as possible. So, you know, that's used elsewhere in workday, and we don't, I suppose, have to reinvent the wheel. So by uptaking their components makes our life a lot easier, but also makes it a lot more consistent. And also, you know, makes it, you know, accessible out of the box, consistent. UI, all those good things we get from uptaking a platform component like that.

David Denham

D

So, again, we'll... Go into a lot more detail of this, um, threading, so kind of a basic version of threading, um, and you'll be looking at the designs for that, and also attachments. So that came up as one of the the use cases, um, support for, um, for one recipient. So in terms of, like, sending it to a candidate or an agency user, and then basic document ingestion, so being able to send and receive attachments from them. And then in terms of out of scope for MVP, So there's a few things that we did hear from our user testing and from our DPGs that we know that customers would like to have, but we don't feel it's going to be a blocker for, you know, the first version that we want to focus on.

David Denham

D

So things like, read receipts. So when a candidate opens an email that a recruiter can actually see, has that candidate read it? And then being able to, you know, run analytics and things like that against that as well. So again, it's something we know that it is possible through the through the platform, but not an immediate um blocker for for MVP UM handling. CC or BCC, uh, or unknown sender forwarding.

David Denham

D

So think about, you know, you're sending an email to someone you're using CC or BCC. So basically, you want to make it visible to them, you want to make them aware. And again, um, that's a use case we heard. When recruiters are working with agencies in particular, they typically cc other users from the agency to make them make them aware. And particularly in more formal business cultures, like in Japan, that's quite common.

David Denham

D

Um, external domains, so, you know, sending an email from us, let's say Target.com. And again, that's something we know customers want, um, I think always sometimes call them vanity domains, so kind of like custom, um, customer customer domains. Essentially so. Um,

so, initially, it's going to be from a workday subdomain, so be, you know, recruiter name as Workday Sana. Um, just to get us up and running.

David Denham

D

And then there are things like Genai that are actually available through the message builder components. So again, that's something we heard during user testing would be nice to have in future. So, you know, being able to use Genai to generate an email, or to do translations or rewrite an email, things like that. So again, there are things we'd like to do in future on the on the roadmap and uptake some of those components. But for the initial UM launch, it's not a, I suppose, it's not a critical um, you know, not a critical Um.

David Denham

D

Part of the part of the scope to have included. Um, so yeah, I've thrown a lot of information at you guys there. In terms of kind of, like, what we're thinking makes sense, in terms of priority. Um, does anyone have any thoughts, questions on any of those? No, Okay, cool.

David Denham

D

So what I have done as well is just linked to a few of the resources here. So again, I think these are worth a look, maybe as we're going through the story mapping and also afterwards as well. So there's a link to our PRD or product Requirements document, which is kind of a shared document with the OE team, where we have. Kind of, like, you know, some of the high level, um, high level requirements there in terms of UM ingestion, outbound emails, things like that. So, um, so, just to kind of have a shared, shared understanding with O.E

David Denham

D

as well. Um, there is, uh, the user research findings that we did. Again. This is probably worth worth a look afterwards in terms of, you know why certain UM requirements were more important than than others, and also the design. Um, there is, uh, Figba as well.

David Denham

D

And Igor, I think you're asking in terms of, is it? is it finalized? And I, I would say it's close, it's probably 90 there. Um, at this stage, there were a couple of open questions we had for, um, we had for our UX team. Um, that they're currently updating.

David Denham

D

So hopefully over the next week or so, I would say as well, like we'll, we'll continue engagement UX throughout. Because as we go into, as we kind of dive in through refinement, there's going to be questions that that come up. So, um, I think we have it in a in a place where hopefully we've got the the biggest questions answered. And you know where, it shouldn't block us from from starting. But I so, as part of what we'd love to do today, is also to capture any open questions.

David Denham

D

On our on the mirror board. In terms of, like, missing use cases or things, maybe that just don't make sense. So, um, the other thing I had to go at doing on Friday was actually just creating a clickable prototype. So this was again just using the Figma file and using um cursor. So I might just click through this just to kind of give a give a flavor of it.

David Denham

D

And so again, I would say, the the figment is our source of truth. This is just more to kind of show, um, at a high level. Like some of the some of the interactions we're thinking, some of

the the error cases we've been thinking about during the spike, things like that. So, um, could ever? Can everyone see that on my screen?

David Denham

D

Maybe just to check? Okay, cool? Um, yeah. So basically again, imagine I'm logged in as a as a recruiter and I'm on the UM candidate profile page. So, Chloe.

David Denham

D

Chloe Clarkson has applied for a marketing coordinator role. And we can see the sliding side panel, or sometimes called the collaboration panel, along here and again. I think in the actual one, you've got probably more up-to-date icons and things like that. But just to give an idea that there's going to be things like notes, SMS. And we'll be adding email here as an option.

David Denham

D

Um, one of the recommendations which came out of the user testing was kind of a discoverability flag. I think this is, as far as I know, and Emily, correct me if I'm wrong, I think this is like part of our design system that we can kind of point out like a new feature to kind of improve discoverability of it. So if you imagine that, maybe we've just introduced this and to help. To help our recruiter discover a two-way email, we can kind of point them in the direction of the new two-way email icon there. So let's say there's been some emails back and forth already with, so let's say Chloe came through an agency.

David Denham

D

So it was an agency that originally submitted Chloe. So let's say we're working with Alex. From the Bright Path Staffing agency. And during the earlier stages of the flow, you know, we

had emailed Alex, and Alex had replied with a couple of questions. So maybe we were following up in terms of coordinating interviews and sharing references for Chloe.

David Denham

D

So let's say we get to, you know, we get through those early stages of the flow. Let's say it's gone. Uh, gone to the interview stage. And um, you know, maybe we want to share a link with Chloe in terms of the Zoom link, maybe that's changed something like that, um, and maybe maybe Chloe needs more information, um, about the about the interview process, or maybe, yeah, maybe she got to the the offer stage. And there's some negotiation happening and maybe we need some, some more documentation, things like that.

David Denham

D

So there's various different use cases there. As to. As to, you know what we might need from from Chloe, we might need to get an updated resume, we might need, you know, there might have been cover letter missing. So we want to ingest those attachments. Um, through here from, um, uh, from Chloe.

David Denham

D

Well, we want to be able to reply as well. Um, so let's say, for this subject, the... Interview request from GMS. And we want to be able to just reply in, uh in rich text format, uh to uh to Chloe from from Rachel, who's our recruiter there. So being able to send, uh, send an email.

David Denham

D

So I don't think it's going to work in the prototype. But um, that's the type of flow that we're, we're, you know, we're looking for. Um, so if we just go back there, um, so that's, I suppose,

let's say, just been. Some existing email sent. if you wanted to send a new, uh, send a new email.

David Denham

D

Um, again, very similar. Uh, you know, we get to this rich text editor, you know, very, very kind of typical of. Um, if you're using something like Gmail. Um, where you know, you've got, uh, you know, a from a two and a subject. Um, in future, you know, we mentioned things like CC, uh or BCC, there are, you know, they're the type of things we like to enhance in future.

David Denham

D

Um, also, if we want to send an attachment, um, you know, we'd like to be able to open our UM, our kind of system UI for attachments. And being able to attach UM documents to be able to send back to back to Chloe there as well. Um, let me just see if there's anything else. Yeah, so as you can kind of see in terms of the design. And you know, once we open it, we'll see kind of a preview pane of the different emails.

David Denham

D

And again, this and this is not perfect, you'll see things like to scroll bars and things like that. So again, this is just more more to show, kind of the interactions and rather than, I suppose, the pixel perfects of the of the Figma. And then once we expand that, we can see kind of the preview of the email and being able to reply in this kind of wider format as well. Let me just see if there's any other ones. You might have a look at just a couple of edge cases as well.

David Denham

D

So in terms of like errors. So let's say we had emailed Chloe and there was a problem. We couldn't deliver the email, so we want to be able to surface that as well. Um, so there's, uh,

there's a few different Um error messages that are available through the through the platform. So again, we have kind of sent us on, um, from AWS.

David Denham

D

Some of the some of the kind of bounce back messages or some of the error messages there. So they're, they're the type of things we'd also like to like to include. So let's say, um, there was, uh, a virus, you know? An email was blocked because, uh, the content flagged as a virus. And so, you know, maybe there was an attachment that had a virus, something like that.

David Denham

D

So again, these are our messages we want to again include when we're thinking about the story map. Was there anything else? Yeah, so just in terms of when we're creating emails as well, to have field level error validations as well. So, you know, maybe it was the...

32:25

David Denham

D

you know, to have error messaging there.

32:28

DUB Brennan 3W.103

D

student.

32:29

David Denham

D

I would say, in the figmas.

32:31

David Denham

D

at the moment.

32:35

David Denham

D

just to show you, um, how we're thinking about.

32:38

DUB Brennan 3W.103

D

math.

32:50

DUB Brennan 3W.103

D

reading.

32:51

David Denham

D

this deck, which I'll send out afterwards as well.

32:57

David Denham

D

there.

32:58

DUB Brennan 3W.103

D

math.

33:01

DUB Brennan 3W.103

D

math.

33:06

DUB Brennan 3W.103

D

math.

33:06

David Denham

D

else you'd call out?

33:08

David Denham

D

we're thinking for MVP?

33:13

DUB Brennan 3W.103

D

at math.

33:13

David Denham

D

or think of?

33:20

DUB Brennan 3W.103

D

I guess just at a high level, like conversations as a whole, for like today, I'll say, like, the we kind of use this term of like the conversation. Life cycle. Which today for SMS and WhatsApp begins at panel open. So for SMS and WhatsApp we only have the possibility of one external person receiving the message, whereas in this case, we might have multiple. So we might need to consider changes there on.

DUB Brennan 3W.103

D

Like, when we actually begin a conversation, the conversation then can go back and forth. Sending your messages back and forth and blah, blah, blah, and then, uh, part of sending back and forth. We have notification capabilities, so stuff like that. There's a few things outside of the panel that exist today, um, that, some of which will get for free, some of which have to update, but just worth considering. And like the usual, um, I guess, just like recruiting level things of like candidate merge and things like that, um, oh.

DUB Brennan 3W.103

D

Also to mention, these conversations will, like, we call it like you're messaging a candidate. But they will exist per job application, so if a candidate has multiple job applications, they can have multiple different conversations in the panel. And then a conversation will end

today when the candidate is either hired or dispositioned. There can be a certain number of days after that that we can leave the conversation open for based on an admin setting. For email, I think there's a hard stop at one year.

DUB Brennan 3W.103

D

So if a conversation is open today, it has to definitely be what we call closed in a year's time. Whether or not the candidate has been hired or disposition by then, it will have to close in a year. So that's like the end of a candidate life cycle, or a conversation life cycle. Um, so yeah, just kind of consider those things as well, like, if you think of other, um, things outside of, I guess, like, yeah, like, the UI is going to be the big piece, a lot of that other stuff. We will already have a lot of pieces in place for we might just need to update them.

DUB Brennan 3W.103

D

Um, but yeah, I think that, or my main pieces for now, I guess, considering that, yeah, that is per job app. And yeah, I'll go through more stuff in the spike. From the technical side of what some of those changes will look like, but I guess from a functional side, those are.

36:02

DUB Brennan 3W.103

D

and purge.

36:06

David Denham

D

absolutely. That's a good point, actually, about merge and purge, because, so if you think about purge, for example, there's got to be some PII as part of the communication. So we want to give the give admins the ability to purge that as well. So, again, just something else

we need to be aware of. Yeah, I suppose, maybe just another consideration as we're going through story mapping.

David Denham

D

I think we mentioned message builder earlier. So, again, Message Builder is kind of a set of components available already for things like, you know, from to subject, the rich text editor. So I suppose, just to be aware, we're not going to be building those ourselves from scratch. I think that would probably take a lot longer. And, you know, we...

David Denham

D

We kind of get, um, reluctant to say for free, but we get, you know, we. We're looking to uptake a lot of those uh components to, you know, to get the kind of get the strengths of those. So, you know. For example, I mentioned they actually have Gen AI uh functionality, not something we're looking to uptake for for EA, um, but in the longer term, definitely. Something we heard from, uh, from customers that they think would be helpful to help draft their, um, their emails.

David Denham

D

So so it's just to be aware when we're going through the story mapping. Um, you know, we might have stories more around, like uptaking, uh, you know, some of this, rather than, you know, we need to build the the bold button, the italics button. Um, it might be more around like uptake, rich text editor, uptake, and you know, some of the different fields. So, um, so, yeah, just something else to be to be aware of there, um. So, the only other thing I would mention before we jump into story mapping is there are a couple of screens we don't have.

David Denham

D

So, I think for the admin, and that's something I think we need to discuss a little bit more around the, you know, the configuration. So I would say, you know, I think for the the majority of the focus, it'll be on the UM, on the side panel, on the on the experience and have a think about merge and purge. Like Emily mentioned as well, um, there are things as well like, uh, like reporting and things like that. Um, which will come in in GA, but not for, not for EA. So again, just to be, just to be aware of that, um.

David Denham

D

But there is a lot of detail, I would say, in the in the Figma. So hopefully that'll be a kind of good inspiration as we as we go through story mapping. And then, like, we really also want to understand, um, you know, I kind of see the the Figma as a... You know, a strong starting point. But there's going to be use cases we think of that are missing and things we need to collaborate with with our UX team, with OE.

David Denham

D

So just I would say we want to capture any open questions or missing use cases here as well as we go. And there are things we can follow up on to get the answers from, or if we need to follow up with customers as well. To get more information, we can definitely do that. OK, cool. So before, yeah, I suppose, before we jump into story mapping, does anyone have any other initial questions in terms of kind of the UM target scope or some of the things we talked about there?

39:41

DUB Brennan 3W.103

D

I have a few questions about the design.

39:46

DUB Brennan 3W.103

D

I saw there one icon close to the notification that's related to conversation. Yeah, the one of the like, the top by the person. So that's a separate feature called My Conversations. And it's... Um, a team built it to basically up until this point.

DUB Brennan 3W.103

D

Notifications everything would go into the Bell icon, you know, like the regular notifications that you get, we would also send notifications about new SMS and WhatsApp messages to the Bell icon. So this team decided that they wanted to kind of separate regular notifications and conversation related notifications, so they built this task called My Conversations. You need to have domain access to use it, and basically all that it does is that if you have access to it. If you have a notification about, say, an SMS message, it will go into that. My conversations and not the bell icon and if you don't have access to the My Conversations domain, your notifications just go into the bell.

DUB Brennan 3W.103

D

So it's just notification, a different section for having specific conversation notifications. Basically. Can I answer from there or just see, you know, if you click into it and it'll just show you, like, a list of new messages if you click one of them. It just brings you to the candidate profile for that conversation and you go back to the panel. I saw in a few places there that it's possible to filter, but I didn't see how it's done.

DUB Brennan 3W.103

D

It's like, filter the messages by I don't know, saying don't read on red and this kind of thing. Yeah, I think that's been moved out of MVP, but we will be able to do it later. So each

message will have like a sender and like whether it's been read or not. We'll have to build some stuff for that piece. But eventually, if we want filtering, we'll be able to see like was where?

DUB Brennan 3W.103

D

Like, if you want to say filter. By send messages.

42:06

DUB Brennan 3W.103

D

candidate. Or ones that I haven't read and things like that.

42:13

DUB Brennan 3W.103

D

we've said that's not going to be an MVP for now. We'll do it later, just because it's a bit of extra work.

42:18

David Denham

D

yep, yeah, absolutely, yeah.

42:25

David Denham

D

yeah, we did. I think you might be still, maybe still one or two of the screens, but yeah, we, we, uh. We removed it from the the MVP screens here. Just, um, I suppose. We're trying to keep these as as close to MVP as possible, so they were originally under these tabs here.

42:42

DUB Brennan 3W.103

D

okay?

42:43

David Denham

D

Um, so yeah, definitely something that's possible, but just in terms of scope, we're keeping it, keeping it as as lean as we can. So they can see things like Sent here, which, you know, we think is probably enough for, you know, for the the E.A. version.

42:59

DUB Brennan 3W.103

D

They can type in the email of the candidate, or it's just a list that they can select the options that is available there.

43:09

David Denham

D

Yeah, so they can't type for the candidates. So I think for, I'll double check this with OE, but I think we're going to limit the from and to. It's going to be obviously just from the recruiter. It's going to be a subdomain email address from the from. They won't be able to change that.

David Denham

D

Then for the two in future. We'd like to be able to, um, have them select, so if the candidate has, you know, multiple email addresses or the agency user, maybe they could choose a different agency user.

43:56

DUB Brennan 3W.103

D

That's a good thing to call out, though, as well. I was going to wait and mention it when we did the technical stuff. But yeah, I know what Dave was mentioning about uptaking some stuff from Message Builder. The from and the to that message builder provide are actually only free text. So the Figma design, since they're drop down, if we do want to stick with drop down, we'll have to build those ourselves and limit the list of what we want in there.

DUB Brennan 3W.103

D

So, yeah, it's good to be aware of if those are drop downs. And I was thinking, it's like, how we can. Close the context of the conversation, if they like, can select different emails for a candidate. Because it's like, I think each may will be a different context area. Yeah, we'll need to keep it tight.

DUB Brennan 3W.103

D

Basically, the way that we do it for SMS and WhatsApp is, we only look at the phone number that's their main or their primary home mobile phone number. So I think we'll probably need to do something similar. For email, like, we can discuss it if we want to put some stickies down for this and like, discuss what we want to do. But yeah, I think we'll either need to be able to handle multiple like emails, or we should limit it to, say, their main primary home email. And that's all that we'll ever email, which I think it's worth discussing, and maybe we and I was wondering some things about that for agency as well, like you mentioned there, Dave of like, if they want to email a different agency user.

DUB Brennan 3W.103

D

That will add layers of complexity to this. So I think, yeah, let's get some stickies down for those cases and then discuss them. When we're when we're like, seeing the flows and if we have more layers.

45:45

DUB Brennan 3W.103

D

then consider as part of, like, future cases.

45:57

DUB Brennan 3W.103

D

if we can.

45:59

David Denham

D

yeah. Yeah, absolutely. As simple as possible. This is what I was thinking. I actually took it from the prototype.

David Denham

D

I just took away the drop downs and just had, now again, this might be an open question with the message builder. Could we make these non-editable for MVP? Again, that might be something we can investigate a little bit further. But yeah, it's making it as simple as possible, because if you think about it, there's no current way to have 2AML in the system. So even just getting the basics and receive working is going to add a lot of early value.

David Denham

D

And then we can layer in things like, you know, selecting different users and things like that. But I think for now, just just having this single, um, single user that's non-editable, I think, you know, would be the core, the core use case there. Um, yeah, good question. Um, okay, cool, so yeah, maybe just in the interest of time, we could jump into story mapping, and I would say, capture any. Any of those other questions, um, on the on the map.

David Denham

D

And then, you know, if there's just something that you know we want to discuss further, add them, add them to the open questions section. And we might initially just take five minutes and we'll see how we get on for time, just to add post-its. So what I, um, what I've tried to do is just give it, like, a high level kind of backbone to the map. So the admin configuration, like I said, I think that's something we need to discuss a little bit more with OE. But if you do have any ideas there in terms of things that we might need to include, I'd say just put them down.

David Denham

D

Kind of quantity over, I'd say, quantity over quality at this stage. So, you know, put down any use case you can think of there, uh. Recruiter initiates the two-way email communication the recipient, so the candidate agency replies their email client, The recruiter manages and engages in the conversation, the privacy admin. Maybe we just put data retention and purging, I might just put Merge there as well. Uh, just just so.

David Denham

D

We capture that, and then for non-functional requirements, they're typically where we capture performance, or, um, exploratory testing, things like that. But yeah, if you can't think

of any of those, I'd say throw them down. So does that make sense then? So just in terms of, um, in terms of format, usually what I what I find the easiest is, let's say recruiter wants to, uh, impose, uh, email, something like that. So think of it from the personas point of view, is the recruiter is the agency, is the candidates, or could be like an admin.

David Denham

D

And just think about what, what they want to do. So, we don't want to get into the exact implementation details at this stage, it's just more around the different use cases. And we will, I think. As Emily mentioned, we will have a follow-on session where we go through the spike in more detail. And then, you know, kind of map out from a technical point of view what we needed.

David Denham

D

But for now, I think just get the use cases down. There's no right or no wrong on these. And then we can, you know, we go away and have a look at kind of, like, what, what's potentially above the line, below the line, and, you know, capture any questions we have for for UX and for OE, and from the Mester Builder team as well. So does that make sense? Give it a go.

David Denham

D

Okay, cool. So we just take five minutes. Yeah, I missed adding the music. Okay, cool. Do we need another minute or two, or?

David Denham

D

Were you okay to start talking through them? Yeah, yeah, okay, cool, cool, um, yeah, cool. So we might just start reading through the the map, and I'd say, feel free to keep adding as as

we go through. Um, but maybe just, uh, maybe just to get us started, um. So, under, the Admin configures platform and channel settings.

David Denham

D

I know that's probably one of our bigger open question areas, but we had a couple here so admin can configure conversation life cycle, tenant setting. Anyone like that one?

57:06

DUB Brennan 3W.103

D

Yeah, I put that one in. Today, we have set two fields in the recruiting tenant setup around this for SMS and WhatsApp. They are related to the SMS and WhatsApp ones, which follow the same lifecycle closure, which for those channels is 180 days maximum. So we'll either want to update those to somehow handle email as well, or need separate ones. If we want to follow that same pattern of allowing some level of customer configurability for when to let a conversation close.

DUB Brennan 3W.103

D

Because today, if you don't have anything set up in that tenant setting, we'll automatically close it after you hire or disposition them. So, yeah, I put a question. I'm not sure if we want to have that configurability. As well for email, if we want to handle it a different way, since email can stay open for a year. Maybe we just want to let it stay open for the year and only close then.

DUB Brennan 3W.103

D

I don't know so, um, yeah, but I just wanted to pop that down for discussion and thoughts.

58:20

David Denham

D

Perfect, yeah, I know. With the other channels as well. I think there was some legal guidance as well as to how long SMS and WhatsApp could stay open. I think the initial guidance I got from our legal team was email doesn't have the same. But yeah, I think that's definitely something we'll need to dive in a little bit deeper to, to see, you know, do we let it open for the year or do we put our own limit on it?

David Denham

D

Cool. Yeah. Yeah. Yeah. Yeah.

58:50

David Denham

D

Yeah.

58:50

DUB Brennan 3W.103

D

happened? When the conversations conversation is closed, it's like, I cannot see. Sorry. Um, No, you can still see them, but you can no longer send messages back and forth. So you just kind of see, like a historical view of the messages, but you can't send any new ones.

DUB Brennan 3W.103

D

Can I create a new conversation? Only with a new job application. So to yet today, we don't handle like closed and open. Although we will kind of have to handle that here. potentially,

because there's a chance that the conversation with the candidate could close at a different time than the agency.

DUB Brennan 3W.103

D

one. So we'll need to balance it, But you can't have a new conversation with the candidate from the same job after. And what happens? It's like, just the reply button, we just hide these? Yeah, for email, we'll need to hide reply button, the forward button, I guess, and the Plus button for creating a new message.

DUB Brennan 3W.103

D

So that they can just view them. That's a good point. What would be the action of the forward button? I think it's literally just creating a whole new email, But I guess if we want to handle like, actually forward, we will want to, like, copy the text and bring that over. But yeah, from what I've asked OVI about, it's essentially just like in our case, it's just a new email message.

DUB Brennan 3W.103

D

It's not anything like too fancy. Like, there's no kind of like, Okay, but I am sending this email to, it's like, would be a CC, or? For now, it's not, it wouldn't be CC, it would be like a new to. So let's say, if you wanted to forward the message from the candidate to the agency user or something like that, it would just be a brand new email. There's not really forwarding.

DUB Brennan 3W.103

D

And I would see in the middle of the same job app. Same job, yeah, same, it might just be. But to a different receiver. Yeah. But yeah, I think forwarding, we might want to discuss if that's something we consider MVP or not, because it kind of could be a bit weird.

DUB Brennan 3W.103

D

Or we'll need to think about it. Yeah, it wouldn't really be a real forwarding. I don't think from what OE has said to me, it would just be a new message with the same text or something like that.

61:21

David Denham

D

I thought I'll have a look back at the research as well, just to just to understand. Maybe that's like, can this communication to agency user? How frequent would that be? Because that, again, that might be something we could look to do in future. It doesn't.

David Denham

D

Yeah, it doesn't seem like a deal breaker. I think CC would be, yeah, CC would be one of the so yeah, different use case, but that's definitely stuff we want to include. Forwarding my fall, it's, uh, into that same bucket, so yeah, it's good. Good question.

61:55

DUB Brennan 3W.103

D

can the agency see the recruiter conversation, or it's like, totally separate? Just the emails that they've sent to the agency user. But not the ones they've sent to the candidate. But the recruiter can see all the agents' conversation? So it'll be.

DUB Brennan 3W.103

D

Recruiter can see messages between themselves and the candidate, and the recruiter can see messages between themselves and the agency. But not like the recruiter can see candidate to agency or anything that happens outside the system.

62:32

David Denham

D

yeah. So again, uh. Agencies, you know, are going to be, you know, working with many different workday tenants and also Workday Sana uh customers as well. So, and you know, some of them have their own systems as well. So yeah, that that agency, the candidate communication happens outside the system, so it's really recruiter to agency and recruiter to candidate.

David Denham

D

There the use cases were, we're targeting here. Uh, yeah, good questions, um, second one I had. Admin can enable disable two-way email as communications channel. Yeah, again, just just a simple one. Um, if they, if they didn't want to enable this, or they wanted to enable us.

David Denham

D

You know, so yeah, how would they do that? I'm thinking that would happen probably again in the same configuration where the other channels are enabled or disabled, But I think it'd be good to get maybe screens of that and kind of talk through it a bit more with OE. So just to capture it there for now. And so, yeah, we had a good few under. The recruiter initiates two-way mail communication.

David Denham

D

I might just read through them all very quickly and then we can discuss any of them a bit further. So, recruiter sees email task in the panel if conditions are mess, Recruiter sees empty state of email task if opened, Yeah, so that's in the Figma. Recruiter can compose an email if the candidate is opted in.

64:08

David Denham

D

can...

64:08

DUB Brennan 3W.103

D

the opt-in? What does this mean? So when a candidate applies to a job and they put their email in, they are kind of telling the system, I'll let you use my email. But because they've not directly said, you can email me. The system will send them an email from using System Workday will send them an email.

DUB Brennan 3W.103

D

Basically, being like, are you happy for us to email you with things? you gave us your email? but are you actually happy for us to email you? And the candidate can say yes or no if they say yes, their email is considered opted in, which means they've opted in to allow workday, or, like the customer to send them emails, they can opt out at any time, which then means workday as system is not allowed to send any modes anymore. Whether it's one way or, in our case, it'll be two-way, is this a feature that we would integrate, or is already there?

DUB Brennan 3W.103

D

It's already there? They're like they, we don't have any split of like two-way and one-way. For email, I don't know if legally we need to have anything else for that, so maybe they can double check what legal if we need text. But I don't think so because for email opt-in, there's no like terms and conditions or anything. It's just you can opt in or not.

DUB Brennan 3W.103

D

And then we can just read that value from the system if you're opted in.

65:32

David Denham

D

Yeah. Yeah. It's in the apply flow, isn't it? They can opt in. Yeah.

65:38

DUB Brennan 3W.103

D

Yeah, there's a few places, but yeah, the apply flow would be the main one.

65:42

David Denham

D

Cool. Recruiter can compose an email to an agency, user or candidate and select the appropriate email. Recruiter expands, collapse the panel to check candidate profile. It's kind of the slide. Slide open, slide closed.

David Denham

D

Recruiter attaches documents to send to candidate or agency user. Recruiter sees panel expand when clicking Add to compose an email. Recruiter doesn't have access to compose the email task. Recruiter wants to format the message. Missing subject line validation.

David Denham

D

Recruiter gets a discard pop up when discarding the email. Yeah, that's in the figma and. Recruiter can switch between tabs for agency and candidates, so again, there's all agency and candidates. So, yeah, do any of those ones not make sense, or does anyone want to comment on any of them?

66:42

Marcos Ampezzan

M

Did I miss anything? Do we have templates or just like...

66:49

DUB Brennan 3W.103

D

No templates for MVP.

66:51

Marcos Ampezzan

M

Okay, cool.

66:53

Marcos Ampezzan

M

So I added one for like, uh, formatting the temp, the email, because then we have to reach that stuff.

66:59

David Denham

D

yeah, yeah, absolutely, uh. Templates is something that is available through, Uh, message builder, so templates, and so templates would be like to have a template for. Let's say, following up on interview availability, you know, it's a message that the recruiter sends frequently and then they can edit it. And then there is one around branding, which is also available through Message Builder, which is again not MVP. If they want to add like, let's say, their logo or things like that to the to the email header, um, they can do that as well.

David Denham

D

So yeah, definitely something on the on the radar, something again, for, you know, uh, probably V2 that will will look to look to uptake. Uh, but yeah, spot on, I think. Records. In terms of the having the rich text editor to be able to, you know, achieve, you know, um, the basic formatting for now. Uh, cool, uh, maybe I just had a question on this.

David Denham

D

One recruiter doesn't have access to the Compose email task? Um, that's just like a um, domain security thing is there.

68:11

David Denham

D

get that one.

68:14

DUB Brennan 3W.103

D

we have separate domains for the SMS and WhatsApp tasks. I presume we'll want the same for email, of having email have its own domain, and what we do for SMS and WhatsApp is. If you have View access, you can view the task and view the messages.

68:38

DUB Brennan 3W.103

D

access, then you can send emails. Which I presume is what would be related to this. So you can go into the compose section.

68:46

David Denham

D

perfect, okay, cool. And any other questions, thoughts, or comments on any of those other ones? I saw a few that were in the in the famous, so, yeah, good to good to capture those. Um, maybe just a quick time check. Um, I know we only have three minutes left.

David Denham

D

Would, uh, would we be able? Would you guys be able to stick around for another 15 minutes? Maybe just to just to talk briefly to the rest of these? Um, if you need to drop, that's that's totally fine.

69:21

Marcos Ampezzan

M

to drop another one.

69:22

David Denham

D

no worries, um, but we will, uh, we will kind of revisit as we get through, you know, you know, we'll have a tech deep dive, and you know, we'll look at these a bit closer, in refinement. But yeah, maybe just to just to go through them and just time boxing for 15 minutes. And um, yeah, again, we can. We can capture any any more kind of, uh, questions that are coming up, uh, so next one, the recipient's candidate agency replies to a message from their email client. Uh, the recruiter receives a notification.

David Denham

D

The recruiter opens the message to read and reply. The candidate attaches not supported files, so it sounds like a kind of an unhappy path and the candidate opts out. And so, yeah, good, good use cases there. Um, so you want to call it?

70:16

DUB Brennan 3W.103

D

When it comes to that opt-out, it's like, we just close the conversation. So we don't close it, but it kind of goes into this in-between stage because theoretically, they could opt back in. So we leave it where it's not closed, but a recruiter can't send any new. Messages. But then if they kind of re-opted in, they could continue.

70:42

David Denham

D

okay, so we'd hide, I guess we'd hide the reply button in that case. Emily.

70:50

D

Yeah, the reply and the add button.

70:53

David Denham

D

Yeah. Perfect. And then cat today. attachments not supported files. Is that one of those?

David Denham

D

Like, there was a virus, or there was the uploaded, like a PSD or something like that? Did I have any? Not sure who added that one. Would it be Marcos? maybe?

David Denham

D

Okay, cool. Uh okay, uh okay. So there's a few in the next one. So the recruiter manages and engages in the conversation, so the recruiter sees a bounce back in the emails. yeah, uh, recruiter sees list of with Unread.

David Denham

D

Ones marked in blue and sent, ones with the send tags. I think we saw that in the the Figma. Recruiter can forward messages. I think we have a, yeah, an open question on that, whether that's MVP or not, so that's something I'll follow up on. UH, Recruiter can see message threads when clicking on a message.

David Denham

D

UH Recruiter sees the panel expand and views full message when clicking the Grow button or clicking a single message. Recruiter doesn't have access to the conversational Notification domain. Recruiter sees error when sending message Rest error. Recruiter can see all communication notifications on the new notification task. Recruiter sends, Message, Recipient receives, and Recruiter sees.

David Denham

D

In the panel, Recruiter sees tags and messages showing updated state so, sent, delivered. So, yeah, I think we saw that in the in the Figma earlier. Uh. Recruiter cannot see Reply, Forward, or Add button when both conversations are closed and sees info message. Uh, question mark that combo is close.

David Denham

D

Yeah, let's maybe let's come back to that one, uh. Agency cannot see recruiter conversation and Recruiter sees info message. I cannot send email if the candidate changes their email, and recruiter can both closed and non-closed conversation the same power if one conversation is still active. So, yeah, few few there, we might want to chat about more. I was just curious on this one, uh.

David Denham

D

Recruiter cannot see Reply, forward or add button when both conversation and close, and sees info message that the conversation is closed.

73:25

DUB Brennan 3W.103

D

Yeah, I put this one.

73:34

DUB Brennan 3W.103

D

for the different states. Like, when they can't continue to engage in a conversation, we let the recruiter know why. That is, whether it's that it's closed, opted out, or the email has changed and things like that. So I'm not sure if we want to do the same here, probably, I would say, but maybe we'll show them in a different way. But yeah, that's kind of what we have for those.

DUB Brennan 3W.103

D

Cases. Is that? Like, if we're doing something that might confuse them, like hiding the add button and things like that, to like, let them know why?

74:09

David Denham

D

yeah, that makes sense. Um, I think that's probably something we can chat about with, uh, with UX, in terms of the best way to communicate that with the, with the recruiter. It's good, good shadows, um, any others, anyone wants to call out or doesn't make sense.

74:29

David Denham

D

forward one, so we'll follow up on that one.

74:35

DUB Brennan 3W.103

D

I have a question. Uh, we are like, uh, splitting the notifications between the common notification and the communication notification. At the moment we are sending the notification. Or it's like when the candidate access the system, it will be defined at that moment, like in execution moment. So what happens is when a reply message comes into the system.

DUB Brennan 3W.103

D

So if the candidate has replied, then as soon as that message gets into the workday, system will trigger a notification to the recruiter. And anyone who sent a message, like multiple recruiters, could send emails, but any recruiter who sent an email in that conversation.

75:19

DUB Brennan 3W.103

D

trigger a notification and then the just the one. So we don't need to worry about the split between the bell and the other one. That we just kind of create an instance of this notification. And then whether it goes to the bell or the other task, just happens, um, through the like OE framework processing.

75:42

DUB Brennan 3W.103

D

need to care about it. No, the only thing for the notification that we need to care about really is what we wanted to say. So today for SMS and WhatsApp. We have them pretty much already there. They say the same thing.

DUB Brennan 3W.103

D

The only difference is the subject for SMS says SMS message and the WhatsApp one says WhatsApp message. So we might just need to do like email message. Um, but the text is the same for both of them, so a lot of it's in place. And like, the triggering of it will happen already, we won't need to actually change that. I don't think it will happen already, because they're all what we call conversation messages.

DUB Brennan 3W.103

D

It's the same class in the background.

76:24

David Denham

D

well, I'll just make a note of that, just to see if we want to follow the same pattern. We can chat with maybe Doc and UX on on that one. Um, but just curious as well, on the they don't have access. Is that similar to one we had earlier? Um, who doesn't have access to conversational notification domain specific to that domain, or is that a duplicate of what we chatted about earlier?

76:53

DUB Brennan 3W.103

D

I created this because I thought we would create the. It's like the tech on top, it's like the the icon below the notification, beside the notification, the new one communication notification, something like that. I thought we would need to handle that, but it looks like we don't, so maybe we can get.

77:14

David Denham

D

Okay, cool, Critter sees error. So this is around the error messages, is it?

77:25

DUB Brennan 3W.103

D

Yeah, I put that one, just because it's kind of a separate type of error. So the other ones that are in the Figma are for like, the message got sent out from our system, fine. And then, for some reason, bounced during the email, like the AWS stuff. But there's also the possibility that our arrest endpoint fails for some reason, whether it's the user lost access or some other validation is in place. And so it's kind of a different error that happens before anything even gets sent out, and it blocks the send completely.

DUB Brennan 3W.103

D

Um, so I think we'll need to handle that as well, um, and maybe have some more error potential, error costs, error screens. For that, or a different way to handle those errors, they're closer to, like the required errors of like, when you click send, it blocks it essentially, but it's just for different reasons. What is calling the rest the UI? Yeah, so yeah, all of the UI is all back. By rest standpoints.

DUB Brennan 3W.103

D

So anything that is visible there or anything like this, all the buttons and stuff would call out to rest endpoints. Do you have any retry in place or something like that? There is for if it's a case that, like, it did get sent but for some reason, wasn't visible on the panel for like, a minute or something. We would like we try calling our get methods, but on send if it fails on the rest standpoint, it's usually because of some like. You need to refresh the page if something has changed that has caused you no longer to be allowed to send it, whether it's the candidate has opted out in the meantime, or you've lost security access.

DUB Brennan 3W.103

D

So we don't usually try and resend it. We try and get them, we encourage the recruiter to refresh the page and see if they're still able to send it again. But they're able to lose all the content. It's like the message that they... Yeah, they have to, like, copy and paste it.

DUB Brennan 3W.103

D

But most of the time, I mean, like, if we do hit a rest error. They're probably not going to be able to send a message again anyway, for whatever the validations are.

79:27

David Denham

D

Yeah. Yeah. Cool. Yeah, that's a good call. So I think maybe we can maybe look at what those different kind of error cases are.

David Denham

D

We can work with again with UX to to get screens for for those. Um, I just have a look at the next one, um. Privacy Admin manages data retention, purging and merge. So, yeah, I had one just for the PDTs, so, um, potentially new PDTs related to candidate or job application. Um, so, maybe for things like the the message body or the subject, or things like that.

David Denham

D

Anywhere where it's likely to have, um, uh, pii. And again, I think. That's probably something we can chat with our privacy and compliance team, uh, to get their guidance on. But yeah, I

think some we'll need something for purge there. I would say I was curious about the Merge one as well, and kind of has two job apps to the.

David Denham

D

Same, uh, job rack. It's merged. Uh, can you say a bit more about that? Whoever added it, could it be Marcus as well?

80:42

DUB Brennan 3W.103

D

Yeah, I didn't add it, but um, I know I mentioned Merge, but we should, we should get merged for free, essentially. Um, because what happens with Merge is that when you merge the two candidates, all all of the job apps just get moved. From the source candidate to the target candidate, and since our conversations are linked at a job application basis, they kind of all just move over. Um, the only issues that we usually have with Merge is if the email will have changed on Merge. Um, but that's when it comes into our like.

DUB Brennan 3W.103

D

The other sticky that I had that was like, if the email changed for some reason, um, we need to handle that in the conversation to kind of like, pause it or whatever. Um, but yeah, anything else like the movement of the conversations. We should get for free because they just come with the job apps, but what will happen with the conversation is like, the job. REC will have two different conversations because we'll need two different contexts, and so the recruiting would be able to see both. Yeah, so yeah, if they were talking to them in two different conversations and they got merged for the same job, same job, right?

DUB Brennan 3W.103

D

Technically two applications, then they can, and just like, decide to carry on both, or email them and say we'll switch to this one. This is about happening.

82:13

David Denham

D

Maybe check? Um, anything else on that one? Can you guys hear me?

82:26

DUB Brennan 3W.103

D

Yeah, sorry.

82:27

David Denham

D

Okay, perfect? Um, so yep, it sounds like we get it for free. We might just double check that, but uh, yeah, and then just on the non-functional ones. Existing reporting features are not broken.

82:42

DUB Brennan 3W.103

D

Yeah, but this one, I assume we're not doing like new delivered reporting stuff for MVP, But as part of what we needed to do for WhatsApp was make sure that our changes didn't break existing reporting for SMS, just because there were a few changes, like in this case, here, we're going to have. To conversations in email and stuff like, we should be okay, like, I'm hoping some of it will have been covered with the changes that WhatsApp made. But we might be making some changes that potentially we need to make sure we update existing reporting fields so that we don't. Break anything?

83:21

DUB Brennan 3W.103

D

just to check.

83:23

David Denham

D

perfect, and yeah, I think longer term mentioned briefly earlier. I think there are some Figma screens for reporting. But yeah, I think for MVP, we're, you know, we're not looking at delivering anything, anything new there. So, yeah, just make sure we don't don't cause any regressions for existing, existing reports. And I just had one there for translations, so just for context.

David Denham

D

So for EA, for early adopter, we're looking to do like a short EA program before GA. So general availability hopefully late October, early November. I think that was off the very early stage estimates. So once we kind of refine these further, we'll have a much better idea in terms of uM, timelines. And if we kind of need to play around with scope or anything like that.

David Denham

D

But it will be off cycle, it won't be 26 or 2, we know that. I think from the the high level estimations, uh, so 26 or 2 plus, so somewhere between 26 or 2 and 27 or 1. Um, we'll be looking to release this off cycle to, um, you know. Probably around 10 early adopter customers, and we had around nine or ten for our DPG group. So a lot of them are interested in taking part in the EA program.

David Denham

D

There's a lot of, I would say. There's a lot of anticipation, uh, particularly from customers in Japan. Uh, where this? uh, where they use agencies a huge amount and they use email a huge amount. So, um, I suppose the reason I bring that up is we will want at least English and Japanese for EA.

David Denham

D

That'll more than likely be sufficient because the other customers we've been talking to were kind of global customers. I did ask it just an initial question to ask translations channel around timings and things like that, given that it would be an off cycle one. But I know we chatted very briefly. EMILy in terms of, you know, are there kind of things we could do in advance in terms of? Like, if we know the error messages and we know some of those labels?

David Denham

D

And that we want. If we did want to get Japanese translations, that we could maybe send them off towards the the start. Um, so yeah, just wanted to capture that again. I don't know if anyone has any thoughts, questions around around, this makes sense. Um, and yeah, again, with, uh, having an EA program, I think we saw that.

David Denham

D

For anyone who's involved, interview team optimization gives us the opportunity to get feedback from customers. Um, early, who are, you know, hands-on playing around us, um, and can let us know kind of what? What might be the the priorities then for for GA? If we're missing anything major? Um, cool, uh, so guys, I know we're just out.

David Denham

D

Quarter past 12. Appreciate everyone staying on. Does anyone have any initial, I suppose, any other kind of open questions at the moment, I would say, feel free to throw them down there. I would say this is just kind of very much the, you know, the starting, zoomed out version. If you do see any other use cases you can think of that we missed, I'd say add them there.

David Denham

D

Next steps, Emily, I think if you're okay, maybe to do, we can do maybe a deeper dive on the spike, and, you know, maybe any, like a dedicated technical discussion on it. Because obviously, I know we've got dependencies, but OE as well, and then we'll revisit this. Um as well. We might just have to think about next sprint, uh, because I know sprint planning is tomorrow again, if there are any initial pieces that make sense to, Um, to start. On, and we can maybe catch up about that, um, offline, Emily, Um, in terms of, in terms of next print, but I suppose, yeah, just in in terms of, you know.

David Denham

D

Major next steps is we'll do a deeper dive from a technical point of view, we'll review this. And we'll start putting it through the normal refinement process from there. So, uh, but yeah, lots of, lots of great kind of use cases there, uh. Things to follow up as well, in terms of open questions, things to follow up with. Are we UX prioritization?

David Denham

D

So really good?

87:41

David Denham

D

Questions there, and, um, yeah, like I say, we'll come back at sprint planning tomorrow just to see are there any other other any initial pieces of this.

87:53

David Denham

D

simple things, so let's let's chat more about. That tomorrow anyone have any last questions or thoughts before we finish up. Okay, cool, um, so yeah. We'll share out the recording as well to for anyone who, um, who missed this. And um, yeah, we'll catch up more on it tomorrow.

88:19

Eoin Corrigan

E

Thanks, David.

88:20

David Denham

D

ya all right bye.

88:21

DUB Brennan 3W.103

D

later.
